- The invention concerns a sensor arrangement comprising a plurality of sensor devices formed on and/or in a substrate, each of the sensor devices having:
  - i. an electric signal converter in the form of a field effect transistor (FET);
  - ii. a sensor element coupled to the signal converter, with which the electrical conductivity of the signal converter following a sensor event on the sensor element can be characteristically influenced;
  - iii. a device for keeping constant an electric
     voltage applied to the signal converter;

- iv. a device for detecting the value of the electric current flowing through the signal converter in the form of a sensor signal.
- 2. A sensor arrangement such as described above is known from document D1, in particular figure 2, IGFET 40, sensor element 32, in conjunction with the description, page 8, lines 28 to 30 and page 16, lines 27 to 32.
- 3. Documents D2 to D6 also disclose sensor arrangements having the above-mentioned features.
- 4. The subject matter of the invention differs from the device known from D1 (or from D2 to D6) by virtue of a calibrating device which is designed such that it can bring the gate region of the FET to an electric potential at which the current is not affected by parameter fluctuations in the FET.

The subject matter of claim 1 is thus novel (PCT Article 33(2)).

5. None of the documents cited in the search report discloses or even mentions this type of calibrating device.

The subject matter of claim 1 is thus inventive (PCT Article 33(3)).

By using this type of device it is possible, for example, to prevent the measuring result from being falsified as a result of different threshold voltages that may arise in the FET during the production process.

- 6. Independent claim 11 concerns a method that corresponds to the device according to claim 1; claim 11 is therefore also considered novel and inventive (PCT Article 33(2) and (3)).
- 7. Dependent claims 2 to 10 and 12 are dependent on claims 1 and 11, respectively, and therefore likewise meet the PCT requirements for novelty and inventive step.
- 8. The invention is industrially applicable (PCT Article 33(4)).
- 9. Additional observations
- 9.1 The calibrating device is defined in terms of its effect, thereby contravening PCT Article 6.

The description, however, discloses a number of possible designs for achieving this effect (see figures 8 to 10 and the corresponding parts of the description). Since the inclusion of one of these designs in claims 1 and 11 would unnecessarily restrict the scope of the claims, it does not appear possible to better define the calibrating device. This definition appears to become clear when the description is used to interpret the claims.

- 9.2 Independent claims 1 and 11 have not been drafted in the two-part form defined by PCT Rule 6.3(b).
- 9.3 Contrary to PCT Rule 5.1(a)(ii), the description does not cite documents D1 to D6 or indicate the relevant prior art disclosed therein.

- 9.4 The features of the claims are not followed by reference signs placed between parentheses (PCT Rule 6.2(b)).
- 9.5 The description and more particularly the wording of the problem on page 9, lines 24 to 28, is inconsistent with the claims (PCT Article 6).
